

# The Musculoskeletal Treatment Pyramid

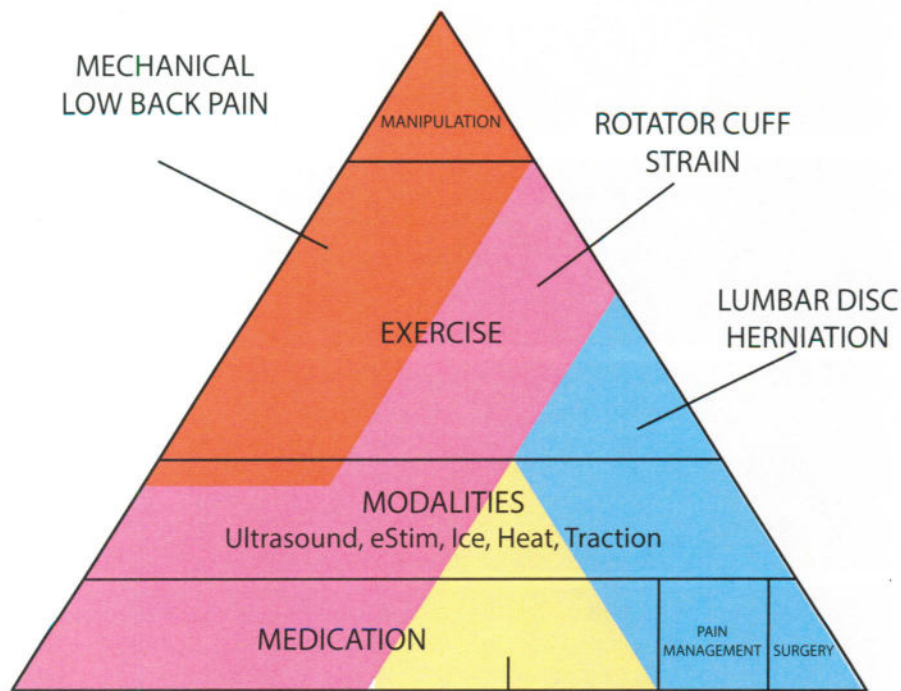

Successful management of musculoskeletal problems is a complex and sometimes challenging task. Most treatment options fall into one of several categories as outlined on the pyramid below. Research shows that medicine, physical therapy modalities, exercise, manipulation, pain management and surgery all have a place on the musculoskeletal treatment pyramid.

Because most musculoskeletal problems are mechanical in origin, rather than chemical, the pyramid is heavy on "physical" treatments.

For example, patients may develop cervicogenic tension headaches from muscle tightness, but that tightness developed as a result of restricted joints that were triggered by weak deep neck flexors and bad posture. Medication is valuable to relieve the tension and inflammation but does little to address the underlying joint restriction and muscle weakness of a true cervicogenic headache.

Different musculoskeletal conditions require different management tools. The literature tells us that some musculoskeletal conditions require multiple tools from different categories for optimal outcomes. Knowing which options are most appropriate for each condition is the hallmark of a great clinician.

Hypothetical model of evidence-based triage of various musculoskeletal problems.

## Make certain that your treatment pyramid is complete and consistent with the current literature.

Research tells us that spinal manipulation is not appropriate for all conditions but is the best choice for conditions like mechanical low back pain or neck pain and cervicogenic headaches. (see all 40+ references in the attached paper: Evidence for the Clinical and Cost Effectiveness of Chiropractic Spinal Manipulation) Physicians who treat these conditions without utilizing chiropractic spinal manipulation are not practicing evidence-based medicine or optimizing their patient's care.

## Choosing the right chiropractor

While many chiropractors can provide modalities and exercises, much like a physical therapist, their unique tool is spinal manipulation. No other discipline has the amount of training in spinal manipulation as chiropractors, but not all chiropractors practice the same way.

Here's how to choose a quality chiropractor for your treatment team:

## A QUALITY PROVIDER WHY YOU SHOULD CHOOSE CANADA CHIROPRACTIC

Dr. Canada closely follows articles pertaining to the evidence-based management of chiropractic conditions.

Dr. Canada only treats musculoskeletal conditions, and is well aware of the contraindications that are associated with chiropractic manipulation.

Our patients are treated uniquely - no generic "three times per week for the next 12 weeks" plans. Dr. Canada measures functional disability (Oswestry, NDI, etc), to establish timely goals and measure progress.

Dr. Canada uses an exercise database for all of the conditions treated based upon current peer-reviewed evidence. Simple, customized exercise plans are given to all patients along with online access to video demonstrations of each of the prescribed exercises.

No one recognizes length of care better than insurance companies. Dr Canada is a credentialed providers with most major insurance companies. Patients who meet their goals are released, and those who do not respond are referred in a timely fashion.

The staff at Canada Chiropractic are grateful to have an excellent relationship with the medical community. We understand our place on your pyramid and will not overstep our ability. You can expect timely, concise and readable communication regarding your referrals. Ask your peers and network specialists who they trust. Chances are, we're in their pyramid too.
